

MUHAMMAD ANAS NAWAZ

Full-Stack Software Engineer | Production Systems & Concurrency | SaaS Architecture | Cloud Infrastructure

Peshawar, Pakistan (Remote) | [Email](#) | [Phone](#) | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

SUMMARY

Full-Stack Software Engineer specializing in building production-grade SaaS platforms, high-concurrency backend systems, and cloud-native applications. Experienced in architecting and shipping complete products across React, NestJS, Flutter, PostgreSQL, Redis, and AWS/OCI, from system design and secure payment workflows to deployment, performance testing, and long-term operations. Built and launched MIKNAZ, a production fintech voucher platform serving the Saudi market, featuring a zero-double-claim concurrency engine, ZATCA-compliant invoicing, payment integrations, and enterprise-grade security; the successful delivery expanded into an ongoing engineering retainer. Seeking a full-time remote software engineering role where end-to-end technical ownership and scalable system design are core expectations.

TECHNICAL SKILLS

Mobile: Flutter, Dart, Riverpod, Provider, GoRouter, Firebase, Geolocator, FCM, APNS

Frontend: React, TypeScript, Tailwind CSS, Vite, React Router

Backend: NestJS, Node.js, REST APIs, WebSockets, JWT, OAuth2, RBAC, BullMQ, Redis (atomic locking)

Databases: PostgreSQL, MySQL, MongoDB, Firebase, Supabase, TypeORM, Prisma

DevOps & Cloud: OCI, AWS (EC2/S3/RDS), Docker, Nginx, PM2, CI/CD, Cloudflare, Let's Encrypt

Testing & Reliability: Jest, Supertest, k6 load testing, Flutter Analyzer, 200+ automated tests

EXPERIENCE

Full-Stack Developer (Freelance, Solo Contract), *Upwork, Saudi Arabia Market*

Feb 2026 – Present

- **Architecture:** Architected and built MIKNAZ solo across 5 milestones: a Flutter mobile app, NestJS backend, two React dashboards, ZATCA-compliant e-invoicing, Moyasar/Tap payments, and Arabic/English RTL localization.
- **Concurrency Engine:** Designed a zero-double-claim voucher engine using Redis atomic locking and PostgreSQL transactions, eliminating duplicate redemptions under concurrent load across four user roles.
- **Security:** Hardened MIKNAZ against CSRF, IDOR, and brute-force attacks with JWT blacklisting, timing-safe comparisons, idempotency keys, and AES-256 encryption, on top of Firebase OTP auth and GPS anti-spoofing.
- **Performance (verified):** Built a 200+ automated test suite and independently load-tested the platform at 200 concurrent users: 152ms p95 response time, 52.1 req/s, zero crashes or database errors.
- **Cloud & Reliability:** Deployed and operate the stack on OCI (Jeddah) with PM2 clustering, Nginx/SSL, and Cloudflare CDN, plus Sentry monitoring, daily backups, and 5-minute uptime checks.
- **Client Trust & Retention:** Led client communication throughout delivery; the engagement converted from a fixed-scope contract into an ongoing retainer, with Phase 2 now in planning.
- **Documentation:** Authored a 4,911-line OpenAPI spec and handover runbook, enabling long-term maintainability independent of the original builder.
- **Design Collaboration:** Worked with the UI/UX designer to review Figma prototypes, provide implementation feedback, and refine user flows before development.

Freelancer, Team Collaboration, *Various International Clients, Onsite, Peshawar*

Jan 2023 – Nov 2025

Backend Developer

- Delivered production-ready backend systems for international clients, owning architecture, APIs, authentication, and integrations across SaaS/MVP, web & mobile apps, e-commerce, CRM/ERP, and booking platforms.

Full-Stack Developer

- Delivered full-stack projects end to end: architecture, APIs, responsive UIs, authentication, and deployment, with direct ownership of both frontend and backend.

Database Engineer (Contract), *CECOS University, Department of Computer Science, Peshawar, Pakistan*

Mar 2024 – Oct 2025

- Contributed to internal academic and administrative systems as part of the backend engineering team, optimizing PostgreSQL queries and integrating Redis caching to reduce database load and response times.
- **SQL Development:** Wrote complex queries using joins, subqueries, CTEs, and window functions; built views, materialized views, stored procedures, functions, and triggers.
- **Performance Optimization:** Diagnosed and resolved slow queries using EXPLAIN ANALYZE, designed and tuned indexes, implemented table partitioning, and ran routine VACUUM/ANALYZE maintenance.

- **Data Integrity & Security:** Enforced primary/foreign keys, unique and check constraints, and ACID-compliant transactions with appropriate isolation levels; configured user roles, permissions, SSL/TLS, and audit logs.
- **Backup & High Availability:** Set up automated backups with point-in-time recovery, tested disaster-recovery restores, and configured replication and failover.
- **Migrations & Monitoring:** Managed schema and data migrations with zero-downtime deployments, and monitored CPU/memory usage, slow query logs, and connection pools.
- **Backend Collaboration:** Wrote optimized queries for API endpoints, tuned TypeORM usage, and implemented Redis caching and connection pooling alongside the backend team.

Mobile Application Developer Intern, *CodeAlpha, Remote*

Aug 2025 – Sep 2025

- Built a fitness tracker app in Flutter with Firebase Authentication and Firestore for real-time data sync, including signup/login and activity-tracking features.

PROJECTS

Calvio Mart, *Full-Stack Developer, Direct Client Engagement, Pakistan*

Dec 2025

- Built a full-featured e-commerce platform (React frontend, NestJS + PostgreSQL backend), deployed via Docker, with 50+ RESTful endpoints documented in Swagger covering catalog, cart, checkout, and order management.
- Built a secure admin panel with RBAC, JWT authentication, bcrypt hashing, OTP verification, WhatsApp order confirmations, and payment gateway integration.

Movr, *Full-Stack Developer, Direct Client Engagement, Pakistan*

Feb 2024 – Apr 2024

- Built a cross-platform mobile app in Flutter (Provider state management, clean architecture) with a NestJS/MySQL/TypeORM backend in a Dockerized, normalized database design.
- Implemented secure RESTful APIs with JWT authentication, comprehensive validation, Swagger documentation, and real-time tracking features.

BM.com | Multi-Tenant Booking SaaS, *Personal Project, Production-Deployed*

Jun 2026

- Built a multi-tenant booking and scheduling platform on Next.js 14 and Supabase, using PostgreSQL Row-Level Security to enforce per-business data isolation at the database layer.
- Prevented double-bookings with unique database constraints and Supabase Realtime slot locking; added Stripe subscriptions with webhook-driven billing sync and idempotent deposit payments.
- Designed a token-based no-login cancellation flow, Resend transactional emails, and a custom dark-mode design system.

Multi-Tenant SaaS Backend, *Personal Project, github.com/manas8938*

Jan 2026

- Built an enterprise-style multi-tenant backend (NestJS, PostgreSQL, Prisma, Docker) with tenant data isolation, RBAC, JWT authentication, and subscription/plan management.
- Added Redis and BullMQ background workers for audit logging, email notifications, and subscription checks.

EDUCATION

BS Software Engineering, CECOS University of IT & Emerging Sciences, Peshawar, Pakistan (2021 – 2025)
